

# Seismic Sensors and Network

Leads - Sergio Barentos, Derrick Salmon

# Discussion Notes

- The University of Chile seismic system is focused on earthquake location & tsunami warning and not really suitable for Observatory early warning system

# Discussion Notes

- The cost is \$25-40K per sensor, 5 would be needed located at coastal locations. serving the region 4 cluster of observatories - Paranal would have to have their own sensors (the conditions for the site are different)

# Discussion Notes

- Recommendation is to form an Observatories working group to produce requirements and project plan for building and implementing a private early warning seismic network.
